

FingerSaver Parts Replacement Policy.

It is the Current policy to Only to Supply the FingerSaver Tool as a finished and tested Working hand safety tool. This policy shall be revised based on consumer/User feedback and further Research and Development on the FingerSaver Tool.

The Fingersaver Design is Such as it does not allow Replacement of the Internal Parts. As the whole Internal part is assembled , pressed and installed in one movement to its correct working position on assembly Line. Once pressed the internal retention washer that sets the correct working position locks itself in position permanently.

Although it is possible to remove the tension puller through the retention washer, it is not advisable neither recommended as very Excessive and dimensionally controlled force is required. We at Aaminah Corporation do not want a safety device to become a potential Source of Injury.

Additionally the uneven force applied can weaken the Central Assembly and cause damage.

With an Aim to improvise and update the current fingerSaver Hand Safety Tool, we are open to feedback from our Esteemed Clients, Consumer and End user.
